The Repace-Lowrey article in Risk Analysis appears to be specifically aimed at OSHA—it proposes theoretical ETS exposures to non-smokers in the workplace (based on modeling) that exceed a de minimus level.

Denise and I spoke with Leo Dreyer and Pat Tyson and agreed that :

- it will certainly make its way into the OSHA docket;
- PM and others should counter it in the docket;
- In the absence of actual workplace exposure studies theoretical exposures will carry some weight with OSHA.

Accordingly, Shook Hardy is preparing a critique of the article with the assistance of R&D-Richmond. They will also identify any third party scientists who may be interested in responding to the article via a letter to the editor, or otherwise.

We will factor this information into our ongoing evaluation of a PM building study. I recommend that we seek approval to go forward with a pilot study in 1993.
